

# Optimize operations with AI-augmented capture

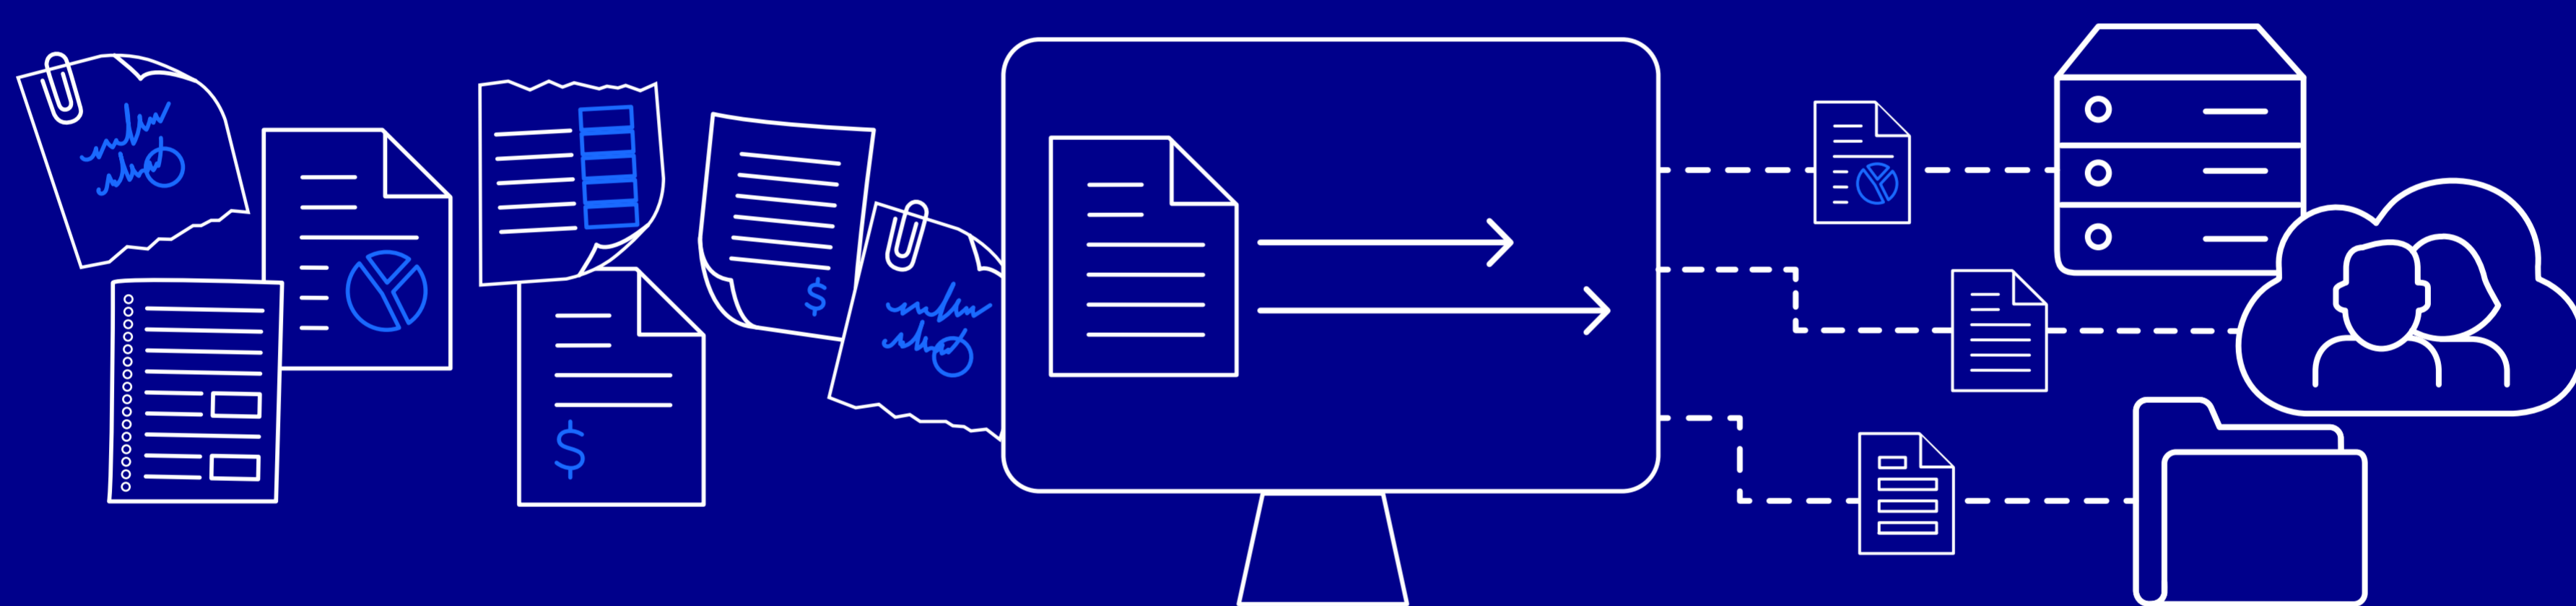

Organizations are drowning in incoming content.

Manually routing information **causes delays, reducing efficiency** and increasing the potential for error.

## Artificial intelligence (AI) can help

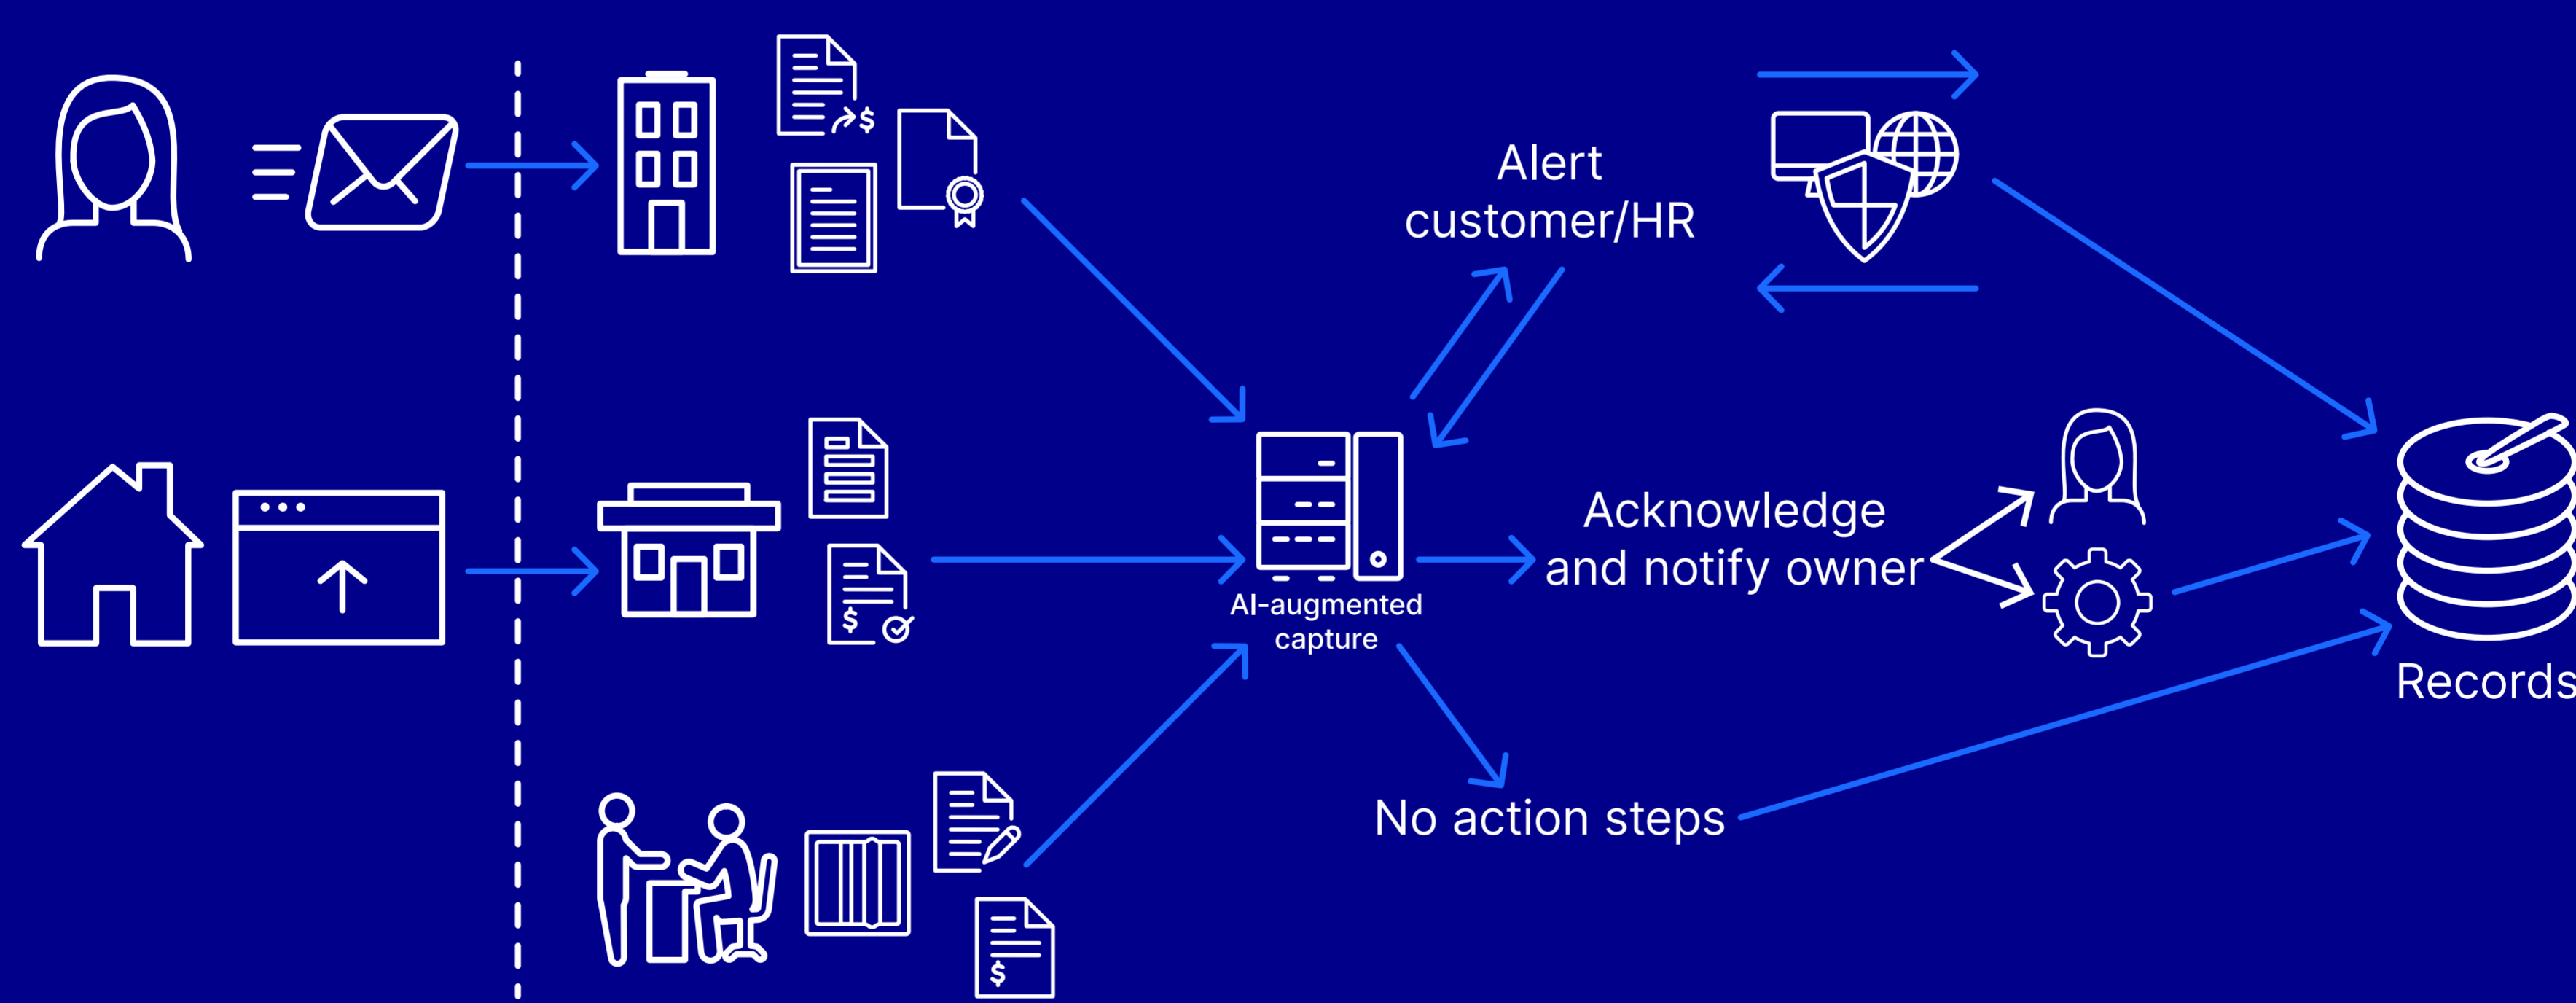

AI-augmented capture reads and understands content, intelligently classifying information to process documents automatically.

## Sample use case

Improving correspondence processing

An organization receives correspondence → AI classifies the information and routes it to the appropriate owner → Correspondence and related actions and results are recorded

- Automate processes to increase employee productivity
- Improve customer satisfaction by preventing processing delays
- Reduce the risk of human error
- Decrease risk and lower operational costs
