Open Text DB Backup Validator
Ensures the integrity of your database backup

Open Text DB Backup Validator is an optional administrator utility for systems based on Open Text Content Server, including Open Text Document Management and Open Text Content Lifecycle Management. DB Backup Validator ensures the integrity of a Content Server database backup for installations using external storage. It enables system administrators to determine if database and external storage images are synchronized upon restoration.

DB Backup Validator extends the backup capabilities of Content Server-based systems for customers who perform hot backups. It adds the ability to resynchronize the external file store after a hot backup has been performed.

There is always some lag time between the creation of the backup database and the creation of the backup external store. During this time, changes to the database or the file store may occur, causing inconsistency. For example, a document may be added during the backup. The corresponding file, therefore, exists in the external file store, but not in the backed-up version of the database. DB Backup Validator reports all documents in the external files store that have no corresponding entries in the database, and offers the option to physically delete these orphaned documents, ensuring that the external file store is synchronized with the database.

Features

- Resynchronize the external file store after hot backups are performed.
- Report on all documents in the external file store that have no corresponding entries in the database, with the option of physically deleting them.
