

OpenText Enterprise Library Web Parts for Microsoft® SharePoint®

Leverage the SharePoint experience and connect to business-critical content across the enterprise

Benefits:

- Allows SharePoint to be used as the front-end to OpenText ECM Suite
- Offers a single view of content
- Federated search from within SharePoint
- Reduces IT costs associated with managing content silos
- Minimizes duplication of content

Features:

Message classification mechanisms: Leverage SharePoint as the user interface for content residing in the Enterprise Library.

Centralized access: Leveraging SharePoint as the user interface to access content in the Enterprise Library.

Federated Search: Search against content that resides natively in SharePoint and content in Enterprise Library. View the search details in a single aggregated set of results.

Extend to other OpenText solutions: Access and interact with content generated by other OpenText products like OpenText Email Management and OpenText Extended ECM for SAP® Solutions.

Leverage LiveReports: Display information from Content Server SQL Server queries through SharePoint.

Workflow Inbox: Use SharePoint as the user interface for your Content Server workflow inbox.

Reduce content duplication: Ensure a single copy of content by exposing content through SharePoint and not having to copy it over.

OpenText Enterprise Library Web Parts for Microsoft® SharePoint® allows organizations to leverage the familiar SharePoint interface, providing a seamless single point of access to content in the OpenText Enterprise Library. By connecting to content spread across disparate data sources such as archives, email, and ERP systems or leveraging key OpenText Content Server capabilities Enterprise Library Web Parts for SharePoint can help organizations enable end-users and drive down IT costs.

The popularity of Microsoft SharePoint across organizations in every industry has grown at a furious rate. Business users now have the ability to gain access to and leverage more critical information through the easy-to-use, familiar interface. IT enjoys the hands-off, self-service approach it provides and the way it engages endusers in vital business processes and workflows. Moreover, CIOs and CTOs like the fact that Microsoft SharePoint fits with the organization's overall infrastructure. But SharePoint is often only one of many content sources and information solutions spread across an organization.

Leverage OpenText Content Server features and functions through SharePoint

With Enterprise Library Web Parts for SharePoint, organizations can interact with OpenText Content Server using SharePoint, working in the user experience they've grown accustomed to—executing actions with the context-sensitive ribbon as well as multi-item operations. The highly configurable Web Parts allow organizations to customize entire SharePoint deployments or use them in dedicated SharePoint Sites. Organizations can also surface Content Server functionality such as custom metadata, records classification, and business workflows, as well as access non-SharePoint object types such as SAP records and archived email.

Organizations can use the familiar SharePoint experience to access content located in the industry-leading Enterprise Library Web Parts for SharePoint and leverage OpenText ECM Suite features and functions through SharePoint.

Connecting content from disparate systems and repositories

The inability to integrate and leverage content spread across disconnected sources can result in lost productivity; drive up integration, management, and administration costs; and mitigate the ability for employees to truly leverage business-critical information. Currently, many organizations are managing and maintaining a multitude of content solutions separately but strive to have a single, universal access point that allows them to search and surface documents disparately spread across their environment.

With Enterprise Library Web Parts for SharePoint, organizations can easily view aggregated content that has been drawn into the Enterprise Library from a number of different data repositories; including email, file shares, SAP®, and legacy sources, amongst others. Additionally SharePoint users can be permitted access to and view official corporate records held in the Enterprise Library.

Enable your organization through Federated Search

Organizations can leverage Enterprise Library Web Parts for SharePoint functionality that enables users to simultaneously search across both content living natively in SharePoint and content in the Enterprise Library. Alternatively, a customized and advanced search experience can be created using a Query Builder to easily 'click' together for more specific and refined search requirements. Result lists clearly mark active and archived content, making it easy for users to identify where documents are located and to understand what stage they might be in their lifecycle. Actionable results list capabilities allow administrators and records managers to aggregate content and execute on bulk records operations.

Extend SharePoint to Content Server solutions

OpenText Email Management solutions provide compliant archiving and records management for email. Enterprise Library Web Parts for SharePoint opens this repository of corporate knowledge to SharePoint. This allows users to access their personal email archive through SharePoint My Sites or surface project-related email in SharePoint Team Sites.

Content Server is deeply integrated with SAP and other ERP systems. Business-critical documents like contracts and invoices are centrally managed in our content repository while SAP users can access them from within SAP user interfaces. With Enterprise Library Web Parts for SharePoint, this content is now also accessible by SharePoint users. Complement collaborative content on project and team sites with relevant information from business transactions.

OpenText Enterprise Library Web Parts for Microsoft SharePoint provides organizations with the ability to leverage the familiar SharePoint experience and gain access to content in the OpenText Enterprise Library while leveraging the functionality of OpenText Content Server through the SharePoint interface.

Available Enterprise Library Web Parts for SharePoint:

- Enterprise Library Web Part for working with Content Server documents and folders
- Enterprise Library Search and Search Result Web Parts for accessing Content Server content
- My Borrowed Items Web Part for interaction with the Content Server Physical Object Module
- LiveReports and LiveReports Results Web Parts for interaction with Content Server LiveReports
