

OpenText Video Services:

Hosted Video Management and Delivery

OpenText Video Services is an integral component of the Customer Experience Management (CEM) suite that OpenText offers to help organizations execute on comprehensive Enterprise Information Management strategies. CEM is a set of technologies that organizations can take advantage of to exceed customer expectations, reach new markets, and provide superior experiences across all digital channels.

Drive greater traffic and engagement with video

With OpenText, organizations are capitalizing on this shift to the video-centric web where content and video are seamlessly combined across multiple channels, creating the most engaging experiences. OpenText Video Services provides a solid foundation that helps organizations manage all content within a unified management workflow and deliver their video assets to computers and mobile devices securely and with customized player experiences.

Reduce the cost and complexity of implementing video

The Video Services deployment model offers organizations the opportunity to reduce the cost, complexity, and time to deploy video to web, mobile, podcast, and IPTV end points. Many companies struggle with how to quickly implement a video solution on top of their existing web infrastructure. Our solution is offered in a rapid-deployment hosted model and was built to integrate to OpenText

web and content management systems so you can be publishing videos on your intranet or public-facing website just days from now.

Increase revenue and visitor engagement with video

Video Services increases user interaction and engagement by providing the ability for users to select specific video segments and share these with others, helping popular shared segments go viral. Shared segments contain an embedded link driving users back to a website for further marketing opportunities, which can contain advertising or promotions surrounding the video.

Video Services user-ready reporting provides valuable insights and details on the popularity of videos, how often these videos are shared, and shows how users are interacting with your rich media content. These reports are presented as “visual heat maps,” showing the areas users are most engaged with, and the intelligence provided enables you to make smarter decisions about the types of content to create and branding messages to include.

VIDEO AND THE WEB

OpenText Video Services helps customers build their brand, sell products, improve communications and learning, and increase advertising revenue by providing advanced video management and delivery capabilities that are integrated with OpenText Customer Experience Management (CEM) solutions. The consumption and use of video across all industries, inside and outside the firewall, continues to see phenomenal growth. The video-centric web is here. Are you ready? OpenText has the solutions that you need to succeed in an increasingly complex web communications environment.

Video Services is a hosted solution

OpenText delivers Video Services as a turn-key hosted service. There is no need to purchase additional hardware to get the solution up and running, and all future upgrades are managed by OpenText.

Video can be integrated onto a website with very little IT involvement. This removes many of the potential barriers to adoption and enables organizations to quickly begin creating video-centric web experiences.

Video Services is ideally suited for enabling user-generated content

Capabilities include the ability to ingest and convert to multiple formats and store and manage galleries. The rise in the amount and popularity of User-Generated Content (UGC) provides additional opportunities for organizations to interact, communicate, and engage with their visitors.

End-to-end video management and delivery

Video Services provides an end-to-end video management and delivery solution, integrated into OpenText product suites that do not require the need for third-party technologies. For instance, many video management solutions require integrations into other transcoding, storage, or delivery technologies to create a complete solution, increasing the time, cost, and complexity of implementation. Video Services has native transcoding capabilities included; redundant, reliable, and scalable storage solutions; and global network delivery capabilities, removing any potential integration complexity. In addition to a robust set of out-of-the-box features, Video Services can be customized to meet the specific needs or requirements for each organization.

Handle simple to complex video requirements

OpenText software integrations, web-based management interfaces, and web APIs: Video Services can handle the spectrum of simple to complex video management requirements. OpenText provides custom video management workflows prebuilt into its Customer Experience Management (CEM) solutions and also offers a web-based interface and a rich set of web APIs to extend all aspects of video ingest, management, transcoding, and delivery. The granular and rich web API enables distinctive flexibility in the implementation and allows for deep integration into web applications based on any language.

Changeable formats and templates: Video formats continue to proliferate with no universal standard for video formats today. Video Services understands this complexity and allows customers to create “recipes” for video transcoding that meet the needs of their business. Video Services can ingest a wide range of origin formats and transcode those video assets to the most popular online web, mobile, and portable device formats that are compatible with media players used by that organization. Customers can choose from a range of pre-existing recipes for common output formats or customize recipes for specific encoding options to control quality, formats, and compression.

Flexible approach to video players: Video Services has a flexible approach to players. While many video management solutions offer limited customization of the player, Video Services allows customers to have full control. Our solution includes an out-of-the-box Flash® player that provides standard play out functionality, includes the ability to share video segments with others, and provides an embed code for easy reuse and replay on any website. Additionally, Flash players can be easily customized to have a branded look and feel to enable design consistency within the rest of the customer’s web experience. More advanced options include taking ownership of the player through the source code or potential integrations into an existing player of the customer’s choosing.

Customers can choose from a range of pre-existing recipes for common output formats or customize recipes for specific encoding options to control quality, formats, and compression.
