

# OpenText Core Fax Accessibility Options

Digital faxing for everyone—accessible, inclusive, and built for all abilities

## Benefits

- Interoperability and multi-device access
- OCR for reader applications
- Native support for Microsoft Windows accessibility

## OpenText Core Fax meets or exceeds accessibility requirements in regulations such as:

- Section 508 (US)
- WCAG (Worldwide)

Communication is essential to daily life, but not everyone is able to communicate in the same way. In line with OpenText’s commitment to accessibility, OpenText™ Core Fax interconnects with assistive technologies to make digital fax more available, accessible, and empowering for everyone, regardless of their abilities.

## Interoperability and multi-device access for equal accessibility

The Core Fax Web Client is optimized for assistive technologies (screen readers, touch controls, speech recognition software, etc.)

In addition, the solution connects to major software tools like Microsoft Outlook, multi-function printers (MFPs), and browsers. We also offer OpenText Core Fax mobile apps for iOS and Android devices. With this broad range of access methods, it becomes much more likely that our solution will suit the requirements of individual users.

## Bringing fax to reader applications

Fax delivers incoming documents either as printed paper or a digital image. Neither of these formats, on their own, are immediately recognizable as text to most screen reader applications. OpenText Core Fax includes OCR functionality that can be used to automatically convert incoming faxes into a form that screen readers can recognize, streamlining access for people with visual impairments.

This accessibility capability is not limited to cloud deployments. It is also available across our XM Fax portfolio, including on-premises and hybrid solutions, ensuring a consistent and inclusive experience regardless of how your organization chooses to deploy fax services.

## OpenText Core Fax interoperability with Microsoft Windows accessibility features

OpenText Core Fax natively supports all Microsoft Windows accessibility features, such as the Magnifier and Narrator tools. These tools allow for magnification of on-screen text and speech narration of menu commands, dialog box options, and more.
