

9 factors to consider when choosing a Content Services Platform

This guide will help you select the right content services solution for your company by considering the 9 most important factors.

1

Consider how you get your information:

Map out your technology infrastructure and understand how your enterprise acquires, stores, manages and uses information.

2

Assess the desired user experience:

Content services enable organisations to completely re-imagine what the user experience could be.

3

Evaluate your current RM and DM procedures:

Assessing your legacy applications gives you an ideal opportunity to take a fresh look at your content management procedures.

4

Ensure the solution extends beyond traditional ECM:

A content services platform should focus on supporting other applications instead of being the single monolithic star of the show.

5

Plan for the future:

Where content and data is stored today—and tomorrow—should be a primary concern when selecting a content services platform.

6

Confirm the platform provides the features you need:

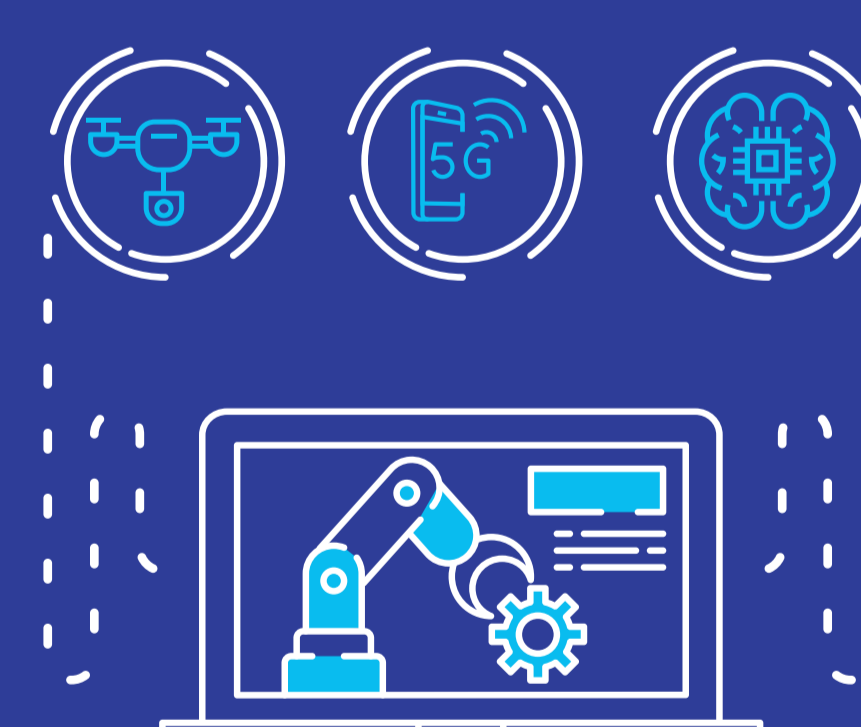

A content services platform must offer functionality that enables workers to make smarter decisions and fuel innovation.

7

Check how emerging technologies are supported:

Content services technology is at the epicenter of the technological revolution that will transform enterprises.

8

Identify relevant regulations and ensure compliance:

A content services platform must be flexible enough to adapt to and incorporate new regulations.

9

Start the selection:

The right content services platform will help you achieve your unique productivity and governance goals with the least effort.
