Organizations today are drowning in content. Not all incoming information is automatically captured and organized, leaving employees to sort it out by hand.

Manually routing information causes delays, reducing efficiency and increasing the potential for error.

Artificial Intelligence (AI) can help

AI-augmented capture reads and understands content and intelligently classifies information to automatically process documents.

Example

AI-augmented capture improves enterprise correspondence processing

An organization receives correspondence → AI classifies the information and routes it to the appropriate owner → Correspondence and related actions and results are recorded

AI-augmented capture:
• Automates processes to increase employee productivity.
• Improves customer satisfaction by preventing processing delays.
• Reduces the risk of human error.
• Helps decrease risk and lower operational costs.

Learn more about how AI-augmented capture can help your organization.
